UPDATE: Use of Post-Industrial recycled content in “SC Type” acoustical matting

GrassWorx continues to maintain an investment in equipment that aids in the regrinding and reprocessing of internal scrap polymer products. We also supplement our internal regrind with purchases of post-industrial “repro” polymer. In the recent past, we have been successful using nearly 100% post-industrial recycled polymer (whether generated internally or purchased from others) in the “core” of our acoustical matting products (excludes the backing). We expect that we’ll be able to continue at our previously committed minimum 50% post-industrial recycled polymer rate for the foreseeable future and will publish a new update if we cannot achieve this minimum.
